Solidatus

Asset management firm transforms investment environment

A globally recognized asset management firm used Solidatus to successfully carry out a multiyear digital transformation project which moved investment processes away from spreadsheets and transferred the management of certain asset types in-house. Solidatus is now used to support and connect key business domains, providing an interface with analytical layers.

The results have had powerful impacts on their business:

- Revealed hidden opportunities.
- Streamlined processes, reducing time to decision from months to minutes.
- Cut costs by 60% by reducing time-intensive, manual work.

The challenge

The program of change used a myriad of technologies and data marts – all of which were implemented using varying methodologies and documentation practices. The result was a fragmented understanding of data flows, which led to inefficient, costly, and time-consuming support and development efforts.

Solidatus was the only solution fit for purpose

After trialing various products, the team turned to Solidatus for its organization-wide, connected governance solution that went far beyond the traditional data lineage and catalog offerings that they had surveyed.

With Solidatus, they now have:

Complete transparency over their data landscape with:

- An enterprise data blueprint that integrates metadata from various sources, simplifies information, and enhances data discoverability and management during migration or decommissioning.
- The ability to conceptualize current and future states, enabling proper assessment of new requirements before final deployment is approved based on changes implemented into the data lineage model.

Speak a common data language, preventing duplication of effort, saving costs with:

- A better understanding of relevant systems, duplicates, and redundancies empowering the team to propose optimizations in source systems, saving costs by retiring fields, tables or even whole systems.
- A single source of truth, allowing analysts to present relevant perspectives of their data environment and create persona-specific views, permitting timely discovery at lower cost.

> ❝ Solidatus is the control center from which our entire migration strategy stems – it visualizes our dependencies, reflects build status, eliminates end-to-end failures, and supports change management planning in many areas.
